

The Avatar Production Accounting application provides sophisticated tracking and reporting for both operated and non-operated production information. This module is designed to allow flexibility in the level of production detail entered into the system based on each company's requirements.

The Production Accounting application integrates with the IHS Energy FieldDIRECT handheld data entry (PDA) technology solution to gather production and volume data from the field. Avatar imports this field data directly into the production application to provide manual reporting or to electronically file to all regulatory reporting agencies. Management reports provide comparative volume analysis with first purchaser statements.

Features and Benefits

Field Capture Integration
State Regulatory Reporting
Well History & Downtime Database
Chemical Type & Usage Database
Daily Gas Meter Volumes
Lease Use Gas Calculation
Run Ticket Netting & Pricing
Well Test Database
Oil & Gas Statements Database
Partner Production Reporting
Route Based Data Entry
Production Summary Database
Production Data Import/Export
Multi-Tier Production Allocations
Production vs. Rev Comparative
Non-Operated Production Data
Non-Op Prod vs. Rev Comparative
12-Month Production Analysis
Daily Oil Production Reporting
Production Detail Reports
Other Dispositions Database
Federal OGOR Reporting
Electronic Reports Filing
Revenue Allocations Interface

Overview

The Integra Production Accounting System provides oil and gas production verification and reporting for operators and producers. The system provides for tracking and reporting of oil, gas, water and other disposition items. The system will allow you to enter oil information directly from the transporter run tickets. The run ticket entry screen provides on screen calculation of the net barrels transported as well as on screen pricing calculations of the run ticket. The system allows for entry of oil purchaser and gas purchaser statement information for regulatory reporting options. The system also allows for electronic import of oil and gas purchaser statements via CODE and GRADE, services of Oildex.

Alternatively, this data can be entered at the well site by company field personnel utilizing the recently introduced IHS ENERGY FieldDIRECT, a handheld data entry (PDA) technology solution. This service enables oil and gas operators to efficiently capture and transmit daily production, pressures, sales volumes, comments, and more via a secure internet connection. This data is immediately available for management reports and comparative analysis. The capture data can be directly imported into the Integra Production Accounting application, which can seamlessly transmit electronically required reports to all regulatory agencies.

In addition, the purchaser statement information may be reconciled against the gauges and run tickets to perform a volume and dollar variance report. These volumes are also compared to the Integra Revenue Distribution system for a volume and dollar variance against the 8/8 information posted from the oil & gas sales/revenue items maintained in history files. The system allows you to setup master file information including tank strapping information. This information allows the system to compute your volumes when you enter your oil gauges and run tickets. Non-operated production information may be input for similar variance analysis reports to verify actual payment for volumes produced.

Integra Production Accounting produces a wide variety of oil and gas production reports. The system will produce tank inventory reports in detail or summary as well as run ticket, oil sales and gas sales listings for a range of months. Monthly production reports for oil, gas and other disposition production and analysis' of oil production are also available. Various state regulatory reports are printed for Texas (PR), New Mexico (C-115), Colorado (Form 7), Wyoming (Form 2), Montana, North Dakota, West Virginia, Kentucky, Pennsylvania and New York for reporting to the state as well as generic monthly report(s) of production information. The MMS OGOR report is produced for federal leases. Comprehensive password security feature is included to protect your accounting records from unauthorized access.
